

Installation guide

1. Install Anaconda

Download Anaconda from there: <https://www.anaconda.com/products/distribution>

Choose Your Download

Run the installer

You don't need to do anything else with Anaconda for now :)

2. Install VSCode

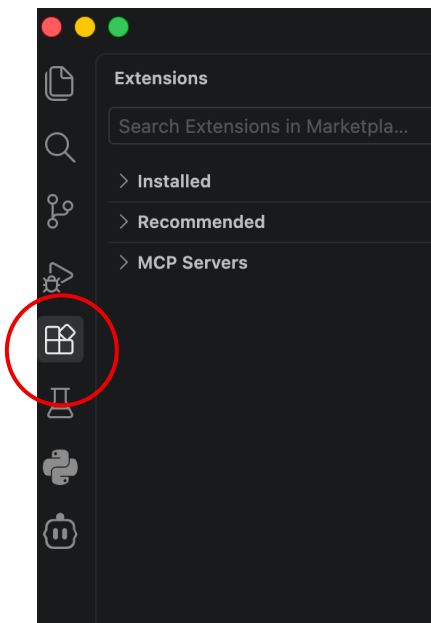

Download VS Code from here:

https://code.visualstudio.com/download?_exp_download=fb315fc982

Run the installer and follow the installation steps.

Open VS Code

On the left side, click on the Extensions icon:

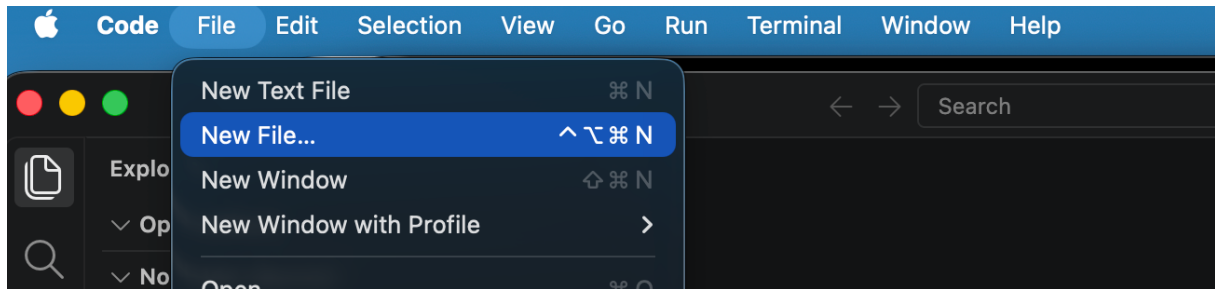

- Install Python (1st in the list)
- Install Jupyter (1st in the list)

3. Create and launch a jupyter notebook

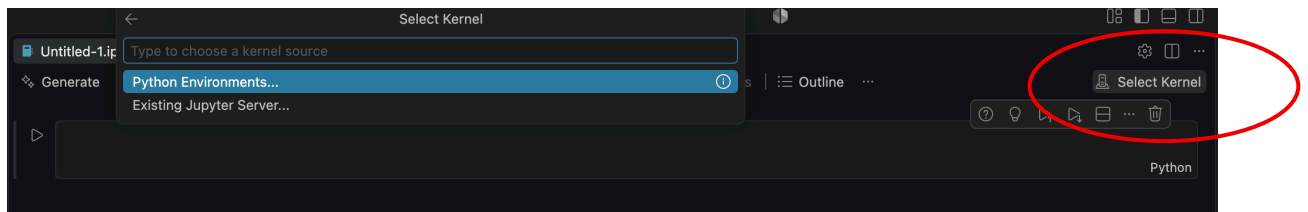

In VS Code, go to « file » → « New file », Select file type → « Jupyter Notebook »

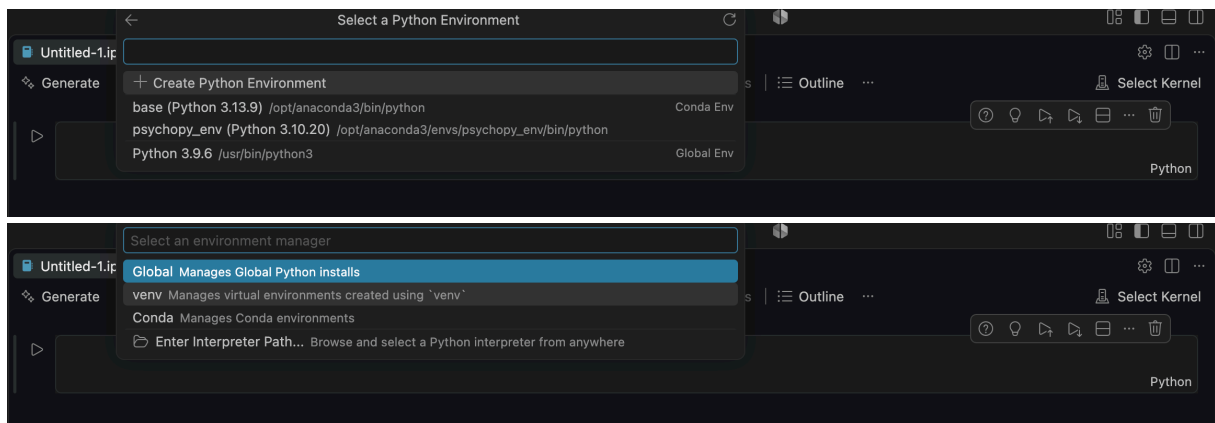

You can also create a notebook by creating a new file with the .ipynb extension

4. Select the Python environment

Go to « Select Kernel » on the right, and then choose “Python environment” in the list

+ Create Python Environment, select « Conda »

You can create the conda environment in the existing workspace (where is the Jupyter Notebook file) or create a specific folder for the workshop and keep every files in it (script, documentations).

In VS Code, use File → Open Folder

Select the workshop related folder (and save everything from the workshop in it).

5. Run the notebook

Once the correct Python environment (« Select Kernel ») has been selected, you can run the notebook cells.

Each cell will have a  Run button next to it.

Click  Run to execute a cell.
